Current  
development

*"up to now, there has been no coastal modelling environment that enables a modular and flexible process (model) integration and cross-domain coupling at the same time and that is open to a larger community of independent biogeochemical and ecological scientists."*

Geosci. Model Dev., 11, 915–935, 2018

## Modular System for Shelves and Coasts (MOSSCO v1.0) – a flexible and multi-component framework for coupled coastal ocean ecosystem modelling

Carsten Lemmen<sup>1</sup>, Richard Hofmeister<sup>1,4</sup>, Knut Klingbeil<sup>2,a</sup>, M. Hassan Nasermoaddeli<sup>3,b</sup>, Onur Kerimoglu<sup>1</sup>, Hans Burchard<sup>2</sup>, Frank Kösters<sup>3</sup>, and Kai W. Wirtz<sup>1</sup>

# Modular approach to the system $\Rightarrow$ MOSSCO

Modular System  
for Shelves and  
Coasts (MOSSCO)

[www.moscco.de](http://www.moscco.de)

## Science questions

1. What are important feedbacks in coastal systems?
2. What determines coastal nutrient gradients and variability?
3. How to value the ecosystem service of nutrient retention (WDF/MSRL) ?

## Specifications

1. Integrate different disciplines, esp. coastal engineering
2. High granularity: couple many (10+) different components
3. Integrate over scales from lab to regional ocean
4. Get a new model to HPC regional in minutes

## Do different

1. Emphasize biological/social on par with physical processes
2. Dare to leave expertise local and let loose of control

# Concept 1: Flexibility

Flexibility means that the system itself is able to deal on the one hand with a ***diverse small or large constellation of coupled model components*** and on the other hand with different orders of magnitude of spatial and temporal resolutions; it is able to deal equally well with ***zero-, one-, two-, and three-dimensional*** representations of the coastal system. Flexibility implies the capability to also ***encapsulate existing legacy models*** to create one or more different “ecosystems” of models. This feature should allow for the seamless replacement of individual model components, which is an important procedure in the continual development of integrated systems. Flexibly in replacing components finally creates a test bed for model intercomparison studies.

## Concept 2: Equitability

Equitability means that all models in the coupled framework are ***treated as equally important*** and that none is more important than any other. This principle dissolves the primacy of the hydrodynamic or atmospheric models as the central hub in a coupled system. Also, ***data components are as important as process components*** or model output; any de facto difference in model importance should be grounded in the research question and not on technological legacy. As complexity grows by coupling more and more models, this equitability also demands that ***experts in one particular model can rely*** on the functionality of other components in the system without having to be an expert in those models as well.

# Up and running in minutes

```
#!/bin/bash

1 export MOSSCO_DIR=$HOME/MOSSCO/code
2 export MOSSCO_SETUPDIR=$HOME/MOSSCO/setups
3 export NETCDF=NETCDF4 (c)

4 git clone --depth=1 git://git.code.sf.net/p/moscco/code $MOSSCO_DIR
5 git clone --depth=1 git://git.code.sf.net/p/moscco/setups $MOSSCO_SETUPDIR

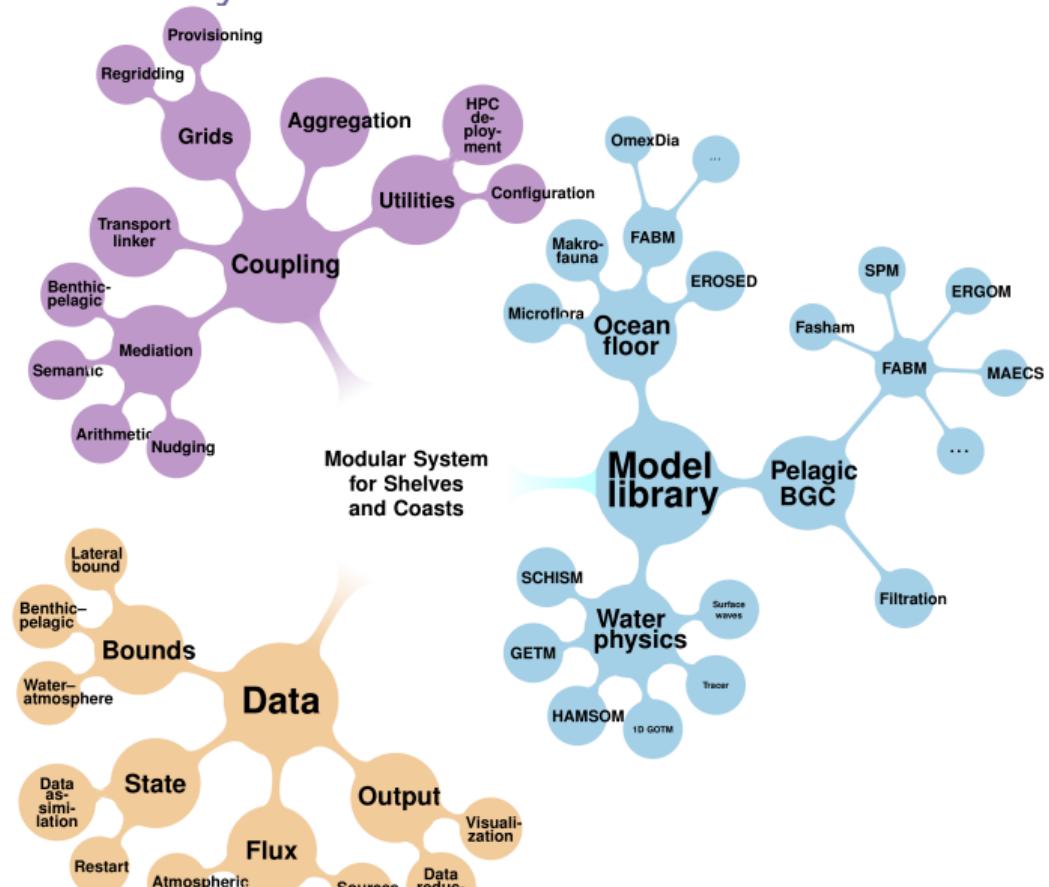

6 make -C $MOSSCO_DIR external # download external codes

7 mkdir -p $HOME/opt/bin
8 export PATH=$PATH:$HOME/opt/bin
9 ln -sf $MOSSCO_DIR/scripts/moscco.sh $HOME/opt/bin/moscco # "installation"

10 cd $MOSSCO_SETUPDIR/helgoland # choose a Helgoland 1D setup
11 moscco jfs # starts a 1D pelagic-sediment simulation
```

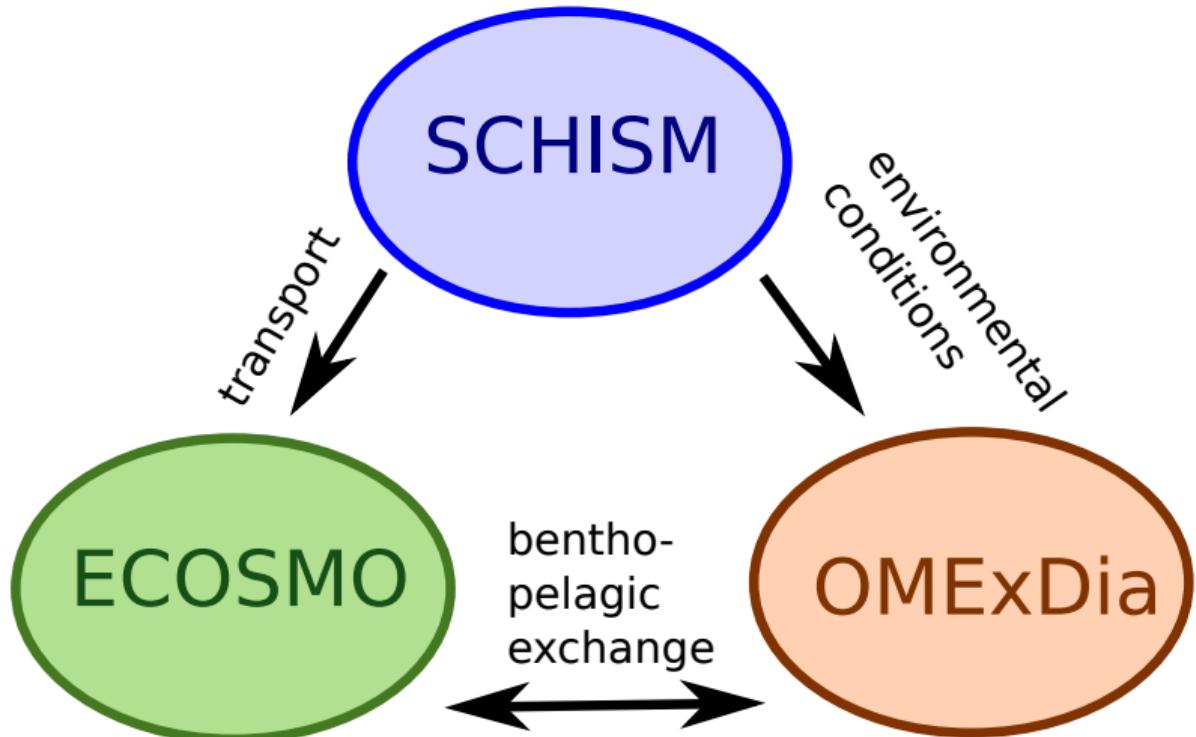

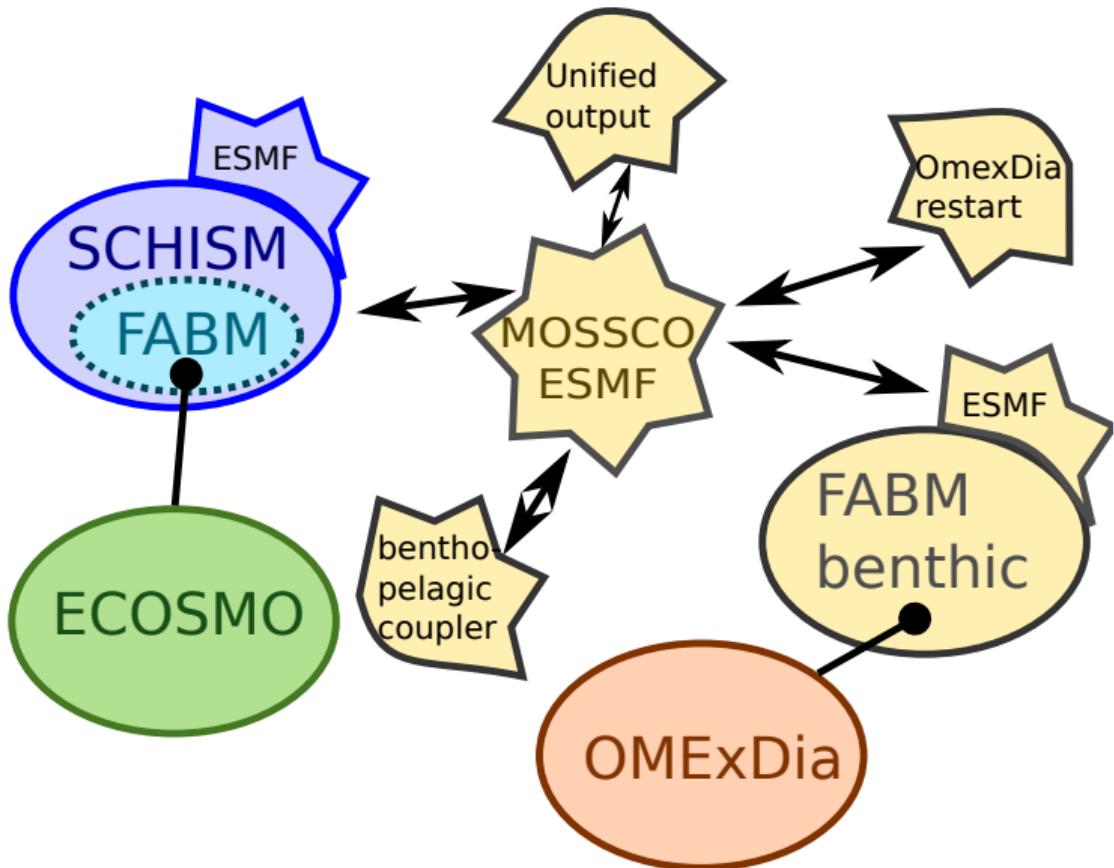

Figure 10: This is what we wanted to do

And ended up with this!

## New models

- ROMS
- mitGCM { color="orange"}
- FESOM-coastal
- SWAN
- ICON
- Macrobenthos
- Sea grass
- PDAF
- WRF/NEMS

## New couplers

- CCA/CSDMS
- OASIS3-MCT (GCoast)
- Regridding
- NUOPC convergence

## New applications

- Multistressors
- Land use, social simulation
