

Fostering lossy compression in the European Earth System Modelling community: SZ compressor and XIOS I/O server as a case study

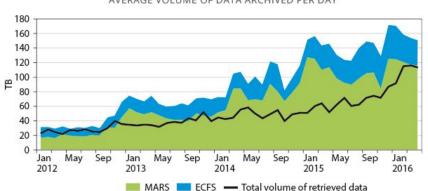

Xavier Yepes-Arbós

Introduction

- The increase in the forecast capability of Earth System Models (ESMs) is strongly linked to the spatial resolution to solve more complex problems.
- This requires a large demand of computing power and it might generate a massive volume of model output which implies:
 - Data must be efficiently written into the storage system.
 - No more offline post-processing is affordable due to the size of the "raw" data.
 - A high cost of storage systems due to the huge data size.
- In this new exascale era, it will be mandatory to implement an efficient I/O management for ESMs.

The XIOS I/O server

- The I/O issue is typically addressed by adopting scalable parallel I/O solutions.
- In the climate community, a widely I/O tool used is XIOS.
- The XML Input/Output Server (XIOS) is an asynchronous MPI parallel I/O server developed by the Institut Pierre-Simon Laplace (IPSL).
- XIOS has the following features needed for climate modelling:
 - Output files are in netCDF format.
 - Written data is CMIP-compliant (CMORized).
 - It is able to post-process data inline to generate diagnostics.

XIOS: Some technical features

- From a computational point of view, XIOS is thought to address:
 - The inefficient legacy read/write process.
 - The unmanageable size of "raw" data.
- By implementing:
 - Scalable parallel I/O.
 - Inline post-processing.
- In addition, it offers lossless data compression using gzip through HDF5.

Test case: OpenIFS and XIOS integration

- **OpenIFS** is an atmospheric general circulation model developed and maintained by the European Centre for Medium-Range Weather Forecasts (ECMWF).
- In the past we integrated XIOS into OpenIFS to address the former inefficient sequential I/O scheme (Yepes-Arbós et al., 2022).
- Although the overhead of outputting data through XIOS is really small for current resolutions, in the future this may well become a bottleneck because of the exponential growth of the output volume.
- The default lossless compression filter of HDF5 does not fit our needs:
 - If compression ratio is high, it takes too much time.
 - If it takes a reasonable amount of time, compression ratio is not enough.

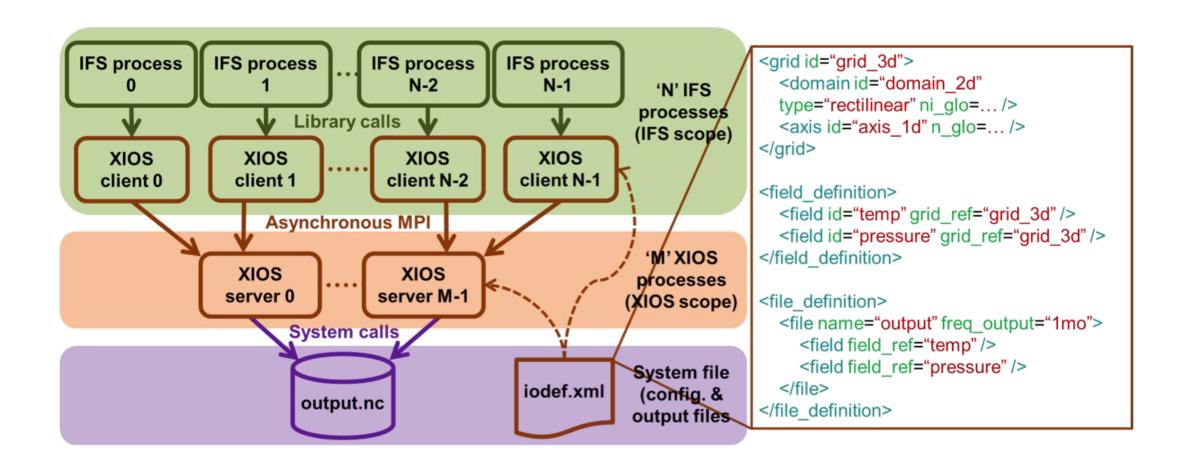

OpenIFS-XIOS integration scheme

What about XIOS compression?

XIOS lossless compression (HDF5 - gzip) running Tco255L91

Cray XC40, compression level 6, 1 XIOS node (2 servers per node), 10-day forecast

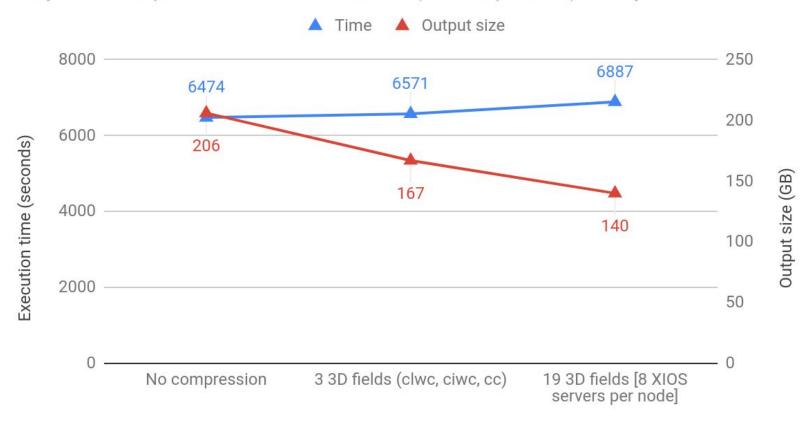

What about XIOS compression?

XIOS lossless compression (HDF5 - gzip) running Tco511L91

Cray XC40, compression level 6, 2 XIOS nodes (1 server per node), 10-day forecast

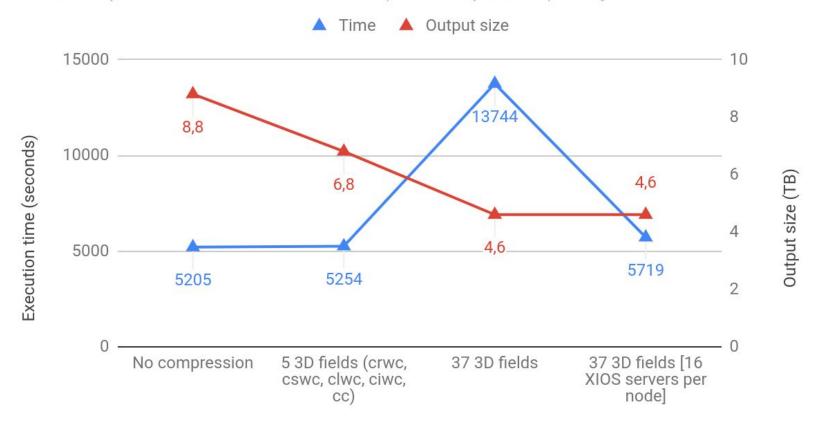

What about XIOS compression?

XIOS lossless compression (HDF5 - gzip) running Tco1279L137

MN4, compression level 6, 20 XIOS nodes (2 servers per node), 5-day forecast

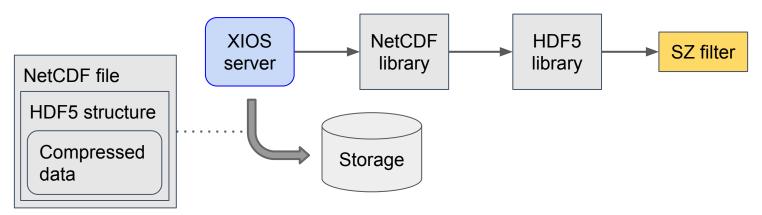

SZ lossy compression filter in XIOS

- Alternatively to lossless compression we wanted to test **lossy compression** and in particular, the **SZ** compressor from the Argonne National Laboratory (ANL).
- We started a collaboration with ANL to explore if SZ is suitable for XIOS regarding these points:
 - Reach high compression ratios.
 - Enough compression speed to considerably mitigate the I/O overhead.
 - Keep high accuracy.
- The SZ compressor is registered as a third-party filter of HDF5 which facilitates the integration in XIOS:

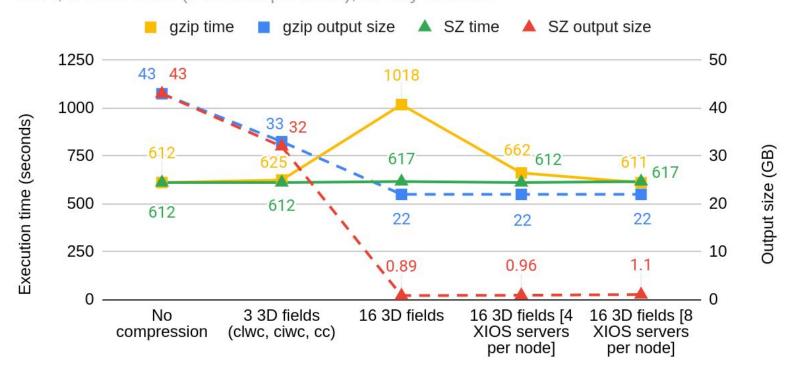

gzip vs. SZ compression: preliminary results

XIOS compression running Tco255L91

MN4, 1 XIOS node (2 servers per node), 10-day forecast

Number of fields compressed

gzip: compression level 6

SZ: relative error bound 0.01

Technical validation

Specific humidity (q):

```
This is little-endian system.
reading data from q_reduced_pl_0000.dat
Min = 9.9999999392252902908E-09, Max = 0.027128605172038078308, range = 0.027128595172038139083
Max absolute error = 0.0002728566
Max relative error = 0.010058
Max pw relative error = 26571.363721
PSNR = 48.814234, NRMSE = 0.0036248356857680394394
normErr = 1.430658, normErr_norm = 0.032378
pearson coeff = 0.999425
```

• Temperature (t):

```
This is little-endian system.
reading data from t_reduced_ml_0000.dat
Min = 178.822265625, Max = 312.271209716796875, range = 133.448944091796875
Max absolute error = 1.4429931641
Max relative error = 0.010813
Max pw relative error = 0.007225
PSNR = 45.400245, NRMSE = 0.0053701664860087792303
normErr = 15926.175641, normErr_norm = 0.002937
pearson coeff = 0.999734
```

Conclusions and future work

- Preliminary results are promising: the SZ lossy compressor is **faster** than the default gzip lossless compressor, achieving much **higher** compression ratios.
- ANL added support to set different compression parameters per field.
 - Change XIOS code to read individual compression parameters and set the SZ filter via the NetCDF API.
 - This will allow us to tune the accuracy of each field depending on scientific needs.
- Discuss with climate scientists the adequate compression parameters (error bounds) for each field depending on the acceptable errors.
- Test the SZ filter with the new HDF5 parallel I/O.
- This work will be further explored and extended in upcoming projects such as EERIE.

Thank you
